1648

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 28 February 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-5,7-27 and 29-34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-5,7-27,29-34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

The Examiner and/or Art Unit location of your application in the PTO has changed. To aid in correlating any papers for this application, all further correspondence regarding this application should be directed to Examiner Nicole Kinsey, PhD, Group Art Unit 1648.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 5 and 15 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. This rejection is maintained for reasons of record.

Applicants state that a Declaration will be provided assuring public availability of the deposited material when allowable subject matter has been indicated. The rejection will be maintained until the assurance is obtained.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 1648

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

To establish a prima facie case of obviousness, three basic criteria must be met. First, there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify the reference or to combine reference teachings. Second, there must be a reasonable expectation of success. Finally, the prior art reference (or references when combined) must teach or suggest all the claim limitations. The teaching or suggestion to make the claimed combination and the reasonable expectation of success must both be found in the prior art, and not based on applicant's disclosure. In re Vaeck, 947 F.2d 488, 20 USPQ2d 1438 (Fed. Cir. 1991). See MPEP § 2142.

Claims 1-4, 7-14 and 16-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Midthun et al. (Journal of Virology, 1985, 53(3): 949-954), designated Midthun '85, Midthun et al. (Journal of Clinical Microbiology, 1986, 24(5): 822-826),

designated Midthun '86, Hoshino et al. (Journal of Medical Virology, April 1997, 51: 319-325), and Clark et al. (U.S. Patent No. 6,113,910). This rejection is maintained for reasons of record.

The claims are primarily drawn to a multivalent immunogenic composition comprising at least four bovine strain reassortant rotaviruses and a physiologically acceptable carrier, wherein each bovine reassortant rotavirus comprises a single rotavirus VP7 gene that encodes a protein that is immunologically cross-reactive with an antigenically distinct human VP7 serotype and the remaining 10 genes derived from the bovine UK strain, and wherein the composition induces an effective immunogenic response to each antigenically distinct human rotavirus VP7 serotype without causing a transient low level fever in a statistically significant number of vaccinees when each of the rotavirus reassortant serotype is administered at a dosage of less than $10^{6.0}$ plaque forming units.

Midthun et al. '85 and '86 teach four human x bovine reassortant rotaviruses where the reassortants have one human gene (D (serotype 1), DS-1 (serotype 2), P (serotype 3) and ST3 (serotype 4)) from a human rotavirus serotype and where the bovine parent/backbone, which is the UK strain, provides the remaining 10 genes (see, for example, Midthun '85 introduction).

Neither Midthun et al. '85 nor Midthun '86 teaches a multivalent immunogenic composition of four reassortant rotaviruses, a physiologically acceptable carrier, induction of an immunogenic response without causing a low level fever, or a dosage.

However, Clark et al. teaches the use of WC3 strain of bovine rotavirus to produce human x bovine reassortants (see, for example, the abstract). Clark et al. also teaches combining different reassortant rotaviruses into a single composition (see col. 7, lines 39-63). Clark et al. states "[t]he vaccine compositions of the invention may desirably include other rotavirus reassortants of the invention, in addition to a G1 reassortant. . . . For example, in one desirable formulation, the invention provides a vaccine composition containing WI79-3,9 and WI79-4 (serotype G1 and P1, respectively). This composition has been shown to elicit a stronger immune response than does a single reassortant rotavirus containing both the human v.p.4 and the human v.p.7 (encoded by gene segment 9). . . . Suitable combination vaccines, which may be univalent, bivalent, trivalent, quadrivalent, quinquavalent or sexavalent may include various combinations of the G1, G2, G3, G4, P1 and P2 reassortants. Other suitable reassortants of the invention may be selected for use in vaccine compositions other than those specified in Table 2 by reference to Table 1 above and the present specification." Clark et al. also teaches suitable carriers (see col. 7, lines 64-66), liquid dose forms (see col. 7, lines 66-67), buffers (see col. 8, line 1), lyophilized forms (see col. 8, lines 2-4), adjuvants (see col. 8, lines 15-17), multiple administrations (see, for example, col. 8, lines 47-52) and methods for stimulating the immune system (see, for example, Example 4). Clark et al. further teaches a general dose range between 10^6 and 10^9 and other dosages of $10^{5.5}$, $10^{6.5}$ and $10^{7.5}$.

Hoshino et al. teaches that the four human serotypes (serotypes 1-4, also disclosed in Midthun et al. '85 and '86) are the most epidemiologically important serotypes (see abstract).

It would have been obvious to one of ordinary skill in the art to modify the teachings of Midthun et al. '85 and '86 to produce a multivalent composition with two, three, four, five, six, etc. reassortants. One would have been motivated to do so given the numerous teachings of Clark et al., in particular, the teaching to produce a multivalent composition of reassortants and to include more than one reassortant to elicit a stronger immune response (see col. 7 lines 43-49) and the teachings of Hoshino et al. There would have been a reasonable expectation of success given the knowledge that Clark et al. successfully vaccinated subjects with reassortant vaccines (see Examples) and also given the knowledge that WC3 strain of Clark et al. and the UK strain are of the same serotype (serotype 6). Finally, the prior art reference (or references when combined) teaches or suggests all the claim limitations. Thus, the invention as a whole was clearly *prima facie* obvious to one of ordinary skill in the art at the time the invention was made.

As for the number of components in the vaccine composition and dosages claimed, it is well within the purview of one of ordinary skill in the art to optimize dosages recited in the claims. According to section 2144.05 of the MPEP, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical. "[W]here the general conditions of a claim are disclosed in the

Art Unit: 1648

prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation." In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955). See also *Peterson*, 315 F.3d at 1330, 65 USPQ2d at 1382 ("The normal desire of scientists or artisans to improve upon what is already generally known provides the motivation to determine where in a disclosed set of percentage ranges is the optimum combination of percentages.")

A particular parameter must first be recognized as a result-effective variable, i.e., a variable, which achieves a recognized result, before the determination of the optimum or workable ranges of said variable might be characterized as routine experimentation. In re Antonie, 559 F.2d 618, 195 USPQ 6 (CCPA 1977). In the instant application, the dosages taught by Clark et al. (10^6 - 10^9 and $10^{5.5}$, $10^{6.5}$ and $10^{7.5}$) produced a recognized result (i.e., neutralizing antibodies, see Example 4 where Clark et al. states "30 of 54 infants, or 57%, given any dose of vaccine developed a virus-neutralizing serum antibody response to one or more of rotavirus serotypes G1, G3, or bovine. This immune response to a primary dose of WI79-3,9 was most often directed against the bovine serotype of rotavirus, WC3, or serotype G1, WI79, reflecting the dual antigenic constitution of the rotavirus reassortant." *emphasis added*). The doses Clark et al. refers to are $10^{5.5}$, $10^{6.5}$ and $10^{7.5}$. Therefore, determining other optimum or workable dosages or reassortants to include in a multivalent composition is routine experimentation.

With regard to citrate buffer, none of the references teach constituting the vaccine in citrate buffer. However, conventional pharmaceutical carriers are obvious alternatives to one another for one of ordinary skill in the art.

Response to Applicants' Arguments

Applicants argue that no conclusion can be drawn from Clark's dosage of $10^{5.5}$ in Example 4 was effective and that Clark et al. teaches a general dose range between 10^6 and 10^9 .

Applicants' argument is unpersuasive. Clark et al., in fact, teaches several doses including a general dose range between 10^6 and 10^9 and other dosages of $10^{5.5}$, $10^{6.5}$ and $10^{7.5}$. Further, Clark et al. states that "30 of 54 infants, or 57%, given any dose of vaccine developed a virus-neutralizing serum antibody response to one or more of rotavirus serotypes G1, G3, or bovine. This immune response to a primary dose of WI79-3,9 was most often directed against the bovine serotype of rotavirus, WC3, or serotype G1, WI79, reflecting the dual antigenic constitution of the rotavirus reassortant." *emphasis added*). The "any dose" Clark et al. refers to includes the $10^{5.5}$ dose (see Example 4). Therefore, contrary to applicants' argument, the $10^{5.5}$ dose of Clark et al. was effective and provides a reasonable expectation of success for the $10^{5.5}$ dose and other doses, and furthermore, because the following trial in Example 5 of Clark et al. used a higher dose ($10^{7.3}$), it does not indicate that the previous dose of $10^{5.5}$ was ineffective.

Applicants further argue that the Midthun et al. references add nothing to the teaching of Clark et al. to suggest that a human x bovine UK reassortant could have been successfully used at a dosage of less than 10^6 .

This argument is also found unpersuasive. As stated above, it is well known that the WC3 strain of Clark et al. and the UK strain are of the same serotype (see, for example Gouvea et al. (Journal of Clinical Microbiology, 1994, 32(5): 1338-1340). Further, Midthun et al. '85 states "[t]he single human rotavirus gene substitution reassortants described in this study represent potential vaccine candidates. The major neutralization protein of these reassortants is derived from the human rotavirus parent, and these viruses should therefore have the desired immunogenicity. It is also likely that the presence of 10 animal rotavirus genes in these reassortants will render such viruses attenuated for humans. This latter supposition is supported by the fact that bovine rotavirus UK and RRV have been administered to susceptible volunteers with a low level of serum antibodies and did not produce illness (Kapikian et al., in press; Wyatt et al., in press). These findings suggest that single human rotavirus gene substitution reassortants may be promising vaccine candidates for use in prevention of human rotavirus disease." Emphasis added. The reassortants described in the Midthun et al. studies were based on the UK strain. Therefore, there is a suggestion that the UK strain be successfully used in human x bovine reassortants at a dosage of less than 10^6 .

Conclusion

No claim is allowed.

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nicole E. Kinsey, Ph.D. whose telephone number is (571) 272-9943. The examiner can normally be reached on Monday through Friday from 8:00 am to 5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bruce Campell can be reached on (571) 272-0974. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
